

## Obtaining optimum horsepower from your Kawasaki Teryx Exhaust

Whether you are new to the world of off-road racing, engine modification and performance evaluation or you are an old pro to the business anyone can appreciate bolt on horsepower! Over time most people have become leery of people promising to add tremendous amounts of horsepower with simple bolt on or swap out parts but every once in a while a part is designed that delivers a cost effective way to add bolt on horsepower and get great horsepower gains at the wheels. After all, the only horsepower that counts is the horsepower being transferred to the ground.

Kawasaki in conjunction with DragonFire Racing has created a new [Teryx exhaust](#) that is not only a bolt on application (in most cases) it's tested to deliver an added 14 horsepower. Now that's a serious gain when you consider that a stock Teryx is rated at 23 horsepower. So with an exhaust upgrade you can almost double the horsepower of your Teryx.

When doubling the horsepower with [Kawasaki Teryx Exhaust](#) as well as with any vehicle, it will be necessary to upgrade the amount of fuel going into the engine and in this case there will need to be a few clutch changes to ensure your clutch can handle the extra speed.

While pre manufactured exhausts are pretty much beginner style modifications that really only require the turning of a few bolts with a torque wrench the additional applications will require a moderate level of knowledge to ensure everything is set up correctly. Jet kits are simple parts that go into a carburetor or fuel injection system to allow more fuel into the engine. This helps to create more horsepower! They only take a basic knowledge of carburetors or injection systems and a good set of instructions to complete and calibrate.

Adding the stage two-clutch kit is a little more involved than just bolting on new parts but if you really want to get the most horsepower out of your vehicle this is a job you must tackle. Within a few hours and attention to details you'll be able to master your clutch and give it the needed parts to handle the extra torque that you'll be sending to the ground.

Horsepower is addictive and usually it's very costly but when you can almost double the amount of horsepower to your vehicle with a bolt on application while getting your hands a little dirty it's a win win investment for fun!
